doi: 10.1111/1475-6765.12466

Unravelling the 'devolution paradox': Citizen preferences for self-rule and for shared rule

ARJAN H. SCHAKEL¹ D & RODNEY SMITH²

Abstract. Recent survey research has revealed a 'devolution paradox': some citizens who favour stronger regional governments inconsistently desire policy uniformity across regions and state-wide intervention in policy provision. It is argued and empirically shown that preferences for regional authority can be broken down into preferences for self-rule – that is, for autonomy for the region – and for shared rule – that is, for collaboration between regional and national governments. Drawing upon the International Constitutional Values Survey, which includes 4,930 respondents from 142 regions in eight countries, it is also shown that preferences for self-rule and shared rule have different impacts. Preferences for self-rule translate into a preference for regional reform that strengthens regional autonomy, whereas preferences for shared rule drive preferences for fiscal transfers from richer to poorer regions. These results are important because they can explain why citizens who are in favour of more regional authority may support an apparently 'paradoxical' set of policy outcomes.

Keywords: devolution paradox; preferences for self-rule; preferences for shared rule; public opinion

Introduction

Public attitudes towards subnational government have become more important in an era of multilevel governance. A significant rise of regional and local authority has re-allocated decision-making powers and policy responsibilities from the national towards subnational governments (Hooghe et al. 2016; Ladner et al. 2019). Public support for decentralisation is crucial for the legitimacy of any multilevel governance system yet surprisingly little research has been devoted to exploring citizen's preferences regarding the allocation of authority and responsibilities between national and subnational governments (Jeffery 2014). The few studies that have surveyed public opinion towards regional authority in Europe, North America and Australia point towards a 'devolution paradox' among citizens who have clear preferences for regional government to do more but are less keen on the idea of policy diversity across regions (Henderson et al. 2013, 2014; Henderson & Weissert 2012; Jeffery & Pamphilis 2016; Weissert & Jones 2015). This constitutes a paradox because a preference for having more regional government is not matched by openness to its logical corollary: that what regional governments with more powers do is likely to vary from place to place (Jeffery 2014: 24–28; see also Brown 2013 and Brown & Deem 2018).

This paper makes two contributions that provide an answer to the 'devolution paradox', drawing upon the unique *International Constitutional Values Survey* (ICVS), which includes 4,930 respondents from 141 regions in eight countries (Australia, Belgium, Canada, France, Germany, Switzerland, the United Kingdom and the United States) (see Brown et al. 2016, 2018). The first contribution is to show that citizens' preferences for greater regional authority are not all the same: they can be broken down into preferences for more self-rule – that is, for an autonomous sphere

¹Department of Comparative Politics, Faculty of Social Sciences, University of Bergen, Bergen, Norway; ²School of Social and Political Sciences, Faculty of Arts and Social Sciences, University of Sydney, Sydney, Australia

for regional government – and preferences for more shared rule – that is, for collaboration between national and regional governments. The ICVS data reveal that citizens differentiate between preferences for self-rule and preferences for shared rule.

The second contribution is to reveal that preferences for self-rule and for shared rule drive citizens' preferences for different policy outcomes central to the devolution paradox. The empirical analysis clearly shows that preferences for self-rule are strongly associated with support for stronger regional government, whereas preferences for shared rule have no impact at all on attitudes towards the strength of regional government. In contrast, while preferences for self-rule and shared rule are both correlated with favourable preferences for fiscal transfers from richer to poorer regions, the impact of preferences for shared rule is almost twice as large than the impact of preferences for self-rule on support for fiscal transfers.

Taken together, these results suggest an important way in which the 'devolution paradox' may appear larger than it actually is. Positive attitudes towards more regional government are driven by preferences for self-rule, whereas positive attitudes towards inter-regional fiscal transfers to ensure policy uniformity across the state-wide territory are mainly driven by preferences for shared rule. This helps to unravel the 'devolution paradox' because preferences for self-rule and shared rule are variations of a preference for more regional authority and each variation is associated with support for a logically consistent policy outcome.

The next section of this paper reviews previous literature on public attitudes towards regional government. The third section explains the relationships between self-rule, shared rule and the devolution paradox and develops hypotheses about how preferences for self-rule and shared rule have different impacts on preferences for regional reform and inter-regional fiscal transfers. The fourth section introduces the ICVS and discusses the main independent variables (preferences for self-rule and for shared rule) and the main dependent variables (preferences for regional reform and for inter-regional fiscal transfers). Method and control variables are discussed in the fifth section and the results are presented in the sixth section. The final section concludes with a discussion of the implications of the results for understanding the devolution paradox.

Previous research on public attitudes towards regional government

Public opinion regarding regional government is rarely studied (Jeffery 2014; Weissert & Jones 2015). This is surprising, considering the omnipresence and increasing relevance of regional governments (Hendriks et al. 2010; Hooghe et al. 2016). Moreover, research indicates that citizen support for subnational governments constitutes an important dimension of diffuse support for the overall constitutional regime of a country. Diffuse support refers to the evaluation of the overall regime, broadly defined by Hobolt and De Vries (2016: 415) as 'the system of government and the constitutional arrangements underlying it'.

Survey research in federal countries typically taps into specific support of citizens. That is, public opinion regarding binding collective decisions and actions taken by political actors operating within the system of government (Norris 1999). Examples of such questions gauge which levels of government provide most value for money, the perceived effectiveness of government levels, the popularity of the taxes raised by different tiers of government, the desirability of intergovernmental fiscal transfers and perceived federal government interference with regional decision making (Brown & Deem 2016; Cole & Kincaid 2006; Cole et al. 2002; Jedwab 2018; Kincaid & Cole 2011, 2016). Questions tapping into diffuse citizen support for

regional governments are lacking, despite the fact that specific support for policies decided and implemented by regional governments is likely to first and foremost depend on the desirability of having a regional government (Brown & Deem 2018: 231; McGrane & Berdahl 2020: 3–4).

Some surveys include questions that ask citizens about their preferences for regional government and most of them tap into the desired level of autonomy for regional government. These questions ask respondents two questions: first, whether a federal form of government (in which power is constitutionally divided between a national and regional governments) is preferable to any other kind of government; and second, which level of government has too much power or needs more power (Jedwab 2018; Kincaid & Cole 2005, 2016). Most frequently, respondents are asked to indicate whether they prefer no regional government at all, the status quo of decentralisation, fewer or more powers for their regional government, or independence for their region (Henderson et al. 2014; Jedwab & Kincaid 2018). This kind of question features often in regional election surveys and public opinion polls fielded in regions where there is broad support for more regional autonomy and independence, such as the Basque Country, Catalonia, Scotland and Quebec (Liñeira & Cetrà 2015).

A serious limitation of these questions is that they tend to conceive preferences for regional government as one dimensional, whereby the allocation of authority between national and subnational governments is a zero-sum trade-off. That is, more authority for one level of government implies less authority for another level of government. This conceptualisation is at odds with how scholars think of regional authority and how regional authority is exercised in practice. Scholars of federalism have long argued that a federal constitution implies both self-rule – that is, the authority that is exercised within a region – and shared rule – that is, the authority co-exercised between regional and federal governments in the country as a whole (Elazar 1987; Riker 1964). Importantly, Hooghe et al. (2016) have revealed that the concepts of self-rule and shared rule travel well to non-federal countries where they help to describe regional authority in unitary and regionalised states.

Self-rule, shared rule and the devolution paradox

Do citizens actually perceive regional government in terms related to the concepts of self-rule and shared rule? Most of the above-mentioned survey questions are geared only towards measuring preferences for self-rule and do not tap into preferences for shared rule. An important exception is the research by A. J. Brown and his co-authors, who have made considerable progress in developing survey questions that measure citizens' diffuse support for a federal constitution through the concept of federal political culture (Brown et al. 2016, 2018). Federal political culture can be understood as 'the extent to which the political attitudes and beliefs of a population reflect attachment to key values associated with federalism' (Brown 2013: 297). It incorporates public attitudes that span diffuse sociological considerations to more specific judgments about institutional design and constitutional structures (Brown & Deem 2018: 226–232). Using a battery of survey questions, Brown (2013) and Brown and Deem (2018) classify most respondents in Australia as clear federalists because they see desirability in both the division of power between federal and state government and legal diversity across the states. However, around a third of the respondents are 'conflicted' because they combine a high preference for a division of power with a low preference for legal diversity or vice versa. These respondents are 'paradoxical' because 'legal diversity largely presupposes at least some division of power, and division of power largely

guarantees at least some legal diversity' (Brown 2013: 302–303; see also Brown & Deem 2018: 236–239).

Brown's approach draws on the 'devolution paradox' developed by Henderson and others to summarise their observations that '... citizens in federal and regionalized states typically want their regional institutions of government to do more than they do now, and central government institutions less; yet at the same time they appear reluctant to embrace what would appear to be logical consequences, namely more inter-regional variation, and less intervention to secure state-wide equity, in public policy provision' (Henderson et al 2013: 304). The idea of a devolution paradox built conceptually on Jeffery's earlier analysis of a 'tension' among citizens in the post-devolution United Kingdom 'between shared values and policy preferences that barely vary ... and a desire for even fuller "ownership" of politics at the devolved level' (Jeffery 2006: 11) or, more simply, a 'tension between equity and diversity' (Jeffery 2009: 73).

While much of the impetus for exploring the devolution paradox came from British political developments (Henderson et al 2013: 304), evidence of the same tension between regional autonomy and national uniformity was soon found elsewhere. Henderson, for example, surveyed 14 regions in five countries (Austria, France, Germany, Spain and the UK). To the question whether a respondent felt that the state or the region should have greater control over political affairs, a clear majority across all regions in both unitary and federal states indicates that the region should have the most influence. At the same time, citizens who desire greater control by the region over political affairs often also indicate that they desire less regional control over various policy areas and that they support policy uniformity across the state-wide territory (Henderson 2014).

In the same study, Henderson (2014: 171–173) suggests that a solution to the devolution paradox may lie in how citizens perceive 'increased regional influence' whereby some citizens think about increased self-rule for their region, whereas other citizens have an elevated level of shared rule in mind (see also Jeffery 2014 and Wincott & Wyn Jones 2014). There is more survey evidence that implies that citizens differentiate between preferences for self-rule and preferences for shared rule. Kincaid and Cole (2016) perform a factor analysis on respondent scores on six survey items in Canada, Germany, Spain and the US and they retrieve two dimensions which they label 'feelings of regional equity' and 'feelings of regional subordination'. The former relates to feelings related to fairness, equity, and respect in the treatment of regions, whereas the latter tap opinions about regional control and independence.

As Kincaid and Cole (2016: 63) note, the theoretical importance of the finding that two latent components underly responses is that 'Citizens consider at least these two dimensions of the region's position in their federation, suggesting that citizens can make somewhat complex distinctions'. The latent dimensions identified by Kincaid and Cole (2016) could tap into preferences for self-rule and for shared rule considering that self-rule is about regional control and independence ('feelings of regional subordination'), whereas shared rule concerns collaboration between regional and national governments who perceive each other as equal partners ('feelings of regional equity').

Assuming that citizens differentiate preferences for self-rule from preferences for shared rule, another question is whether these indicators – as proxies for diffuse regime support – drive perceptions on specific policy outcomes (Brown & Deem 2018: 226–232). In other words, do preferences for self-rule and for shared rule underlie opinions towards different policy outcomes? Jeffery and Pamphilis (2016) provide compelling arguments that this is the case in Germany. They find that citizens in Bavaria are less in favour of fiscal transfers from rich to poor

regions than citizens from Thuringia and these preferences are boosted by stronger regional attachments. Citizens in both German *Länder* also think 'paradoxically' because citizens with strong attachments to their *Land* also believe that their *Land* government ought to be more influential nationally. Jeffery and Pamphilis (2016: 188–189) explain this as follows:

... Thuringians wanted a strong influence for their Land government in state-wide decision making, seeing this as the best means of securing policies like fiscal equalisation that benefit their Land. Bavarians by contrast were more divided, with a substantial proportion seeing disadvantage accruing from state-wide policies like fiscal equalisation and looking to the Land government to work more at Land level to secure their interests. To put this into the language of comparative federalism research, Thuringians appeared to favour shared rule involving cooperation of federal and Länder governments in setting state-wide policy standards, while Bavarians appeared divided between those favouring shared rule and those favouring a more autonomous form of self-rule.

This is an important observation because it implies that citizens differentiate between preferences for self-rule and preferences for shared rule, that they can do so differently across regions within the same county, and that these preferences are differently linked to the desirability of specific policy outcomes. Bavarians are more in favour of self-rule for their *Land* and are therefore inclined to dislike the idea of inter-regional fiscal transfers, whereas Thuringians are more in favour of inter-regional fiscal transfers because they tend to be more supportive of shared rule between *Land* and federal governments.

In the next section, we develop two indicators that tap into preferences for self-rule and preferences for shared rule and provide evidence that citizens differentiate between these preferences. Then we discuss the two questions that are used to tap into preferences for regional reform and for inter-regional fiscal transfers. These four measurements enable an empirical test of two propositions suggested by Jeffery and Pamphilis (2016) that will guide the empirical analysis in the results section:

Hypothesis 1: A preference for self-rule is positively related to a preference for regional reform that empowers regional government.

Hypothesis 2: A preference for shared rule is positively related to a preference for interregional fiscal transfers from richer to poorer regions.

The ICVS dataset: Self-rule, shared rule, regional reform and inter-regional fiscal transfers

This paper relies on the ICVS, which includes questions that tap into citizen preferences for preferences for self-rule and shared rule as well as regional reform and inter-regional fiscal transfers. We use the second wave of the ICVS (Brown et al. 2018) because it adds three countries (Belgium, France and Switzerland) to the five in the first wave (Australia, Canada, Germany, United Kingdom and United States). A stand-alone survey in Australia was fielded online between 3 and 10 August 2017 by OmniPoll through panels managed by LightSpeed Research. The other seven countries were surveyed by KantarTNS who used the Ncompass internet omnibus survey between 19 and 24 April 2018. To achieve maximum representativeness, sample quotas were set

<i>Table 1.</i> Included countries, regions and number of responde	number of respondents

for each state/region, gender and age. More detail on the ICVS is provided by Brown et al. (2016, 2018).

Table 1 provides an overview of the included regions and number of respondents for each of the eight countries. The ICVS includes 4,930 respondents from almost all regions of the eight countries. The few exceptions that are not included are three territories in Canada, one region in France, two cantons in Switzerland and two states in the United States. The number of respondents varies widely across regions and this is taken into account by employing multilevel regression models (which are discussed in more detail below).

The main independent variables: Preferences for self-rule and shared rule

The ICVS is particularly useful to explore citizen's preferences towards regional government because, to the best of our knowledge, it is the only cross-national survey that taps into preferences for self-rule and shared rule instead of preferences for regional authority in general. Respondents were asked to indicate whether they found the six features of multilevel government displayed in Table 2 desirable or undesirable. The question reads: 'Please state if you think each of these is a desirable feature, or an undesirable feature of having different levels of government'. The survey questions and items deliberately did not include the terms 'federal', 'regional authority', 'self-rule', or 'shared rule' to avoid complications arising from a lack of familiarity with these terms among respondents and to allow for comparisons between federal and non-federal countries (Brown et al. 2016, 2018).

Items 1, 2 and 3 tap into preferences for having divided powers, legal diversity and governmental accountability. These items are measures of the concept of self-rule, that is, the extent to which regional governments exercise authority over citizens who live in the region. Items 4, 5 and 6 measure aspects of a preference for shared rule, that is, the extent to which regional governments exercise authority in the country as a whole through collaboration.

Explanatory and confirmatory factor analysis (see Table A1 and Figure A1 in the Appendix in Supplementary Information) provides strong evidence that these six survey items validly

Table 2. Survey items used to measure preferences for regional authority, self-rule and shared rule

Preference for	Item number	Item wording
	1	Having power divided up between different levels of government
Self-rule	2	Allowing different laws in response to varying needs and conditions in different parts of [name of country]
	3	Different levels of government having power to hold each other to account for problems
	4	Allowing the governments of different parts of [name of country] to get involved in decision making on national issues
Shared rule	5	Different governments arguing over the best way to solve a particular problem
	6	Different levels of government being forced to respect each other's roles and responsibilities when dealing with a problem
Regional authority	1–6	All six items

Notes: The items were preceded with the following question: 'Please state if you think each of these is a desirable feature, or an undesirable feature of having different levels of government'. Respondents could indicate whether these features were very desirable (score of 4), desirable (3), undesirable (2) or very undesirable (1). The order of the statements was randomised. Respondents who opted for 'can't say' are excluded from the analysis.

and reliably tap into preferences for regional authority, self-rule and shared rule. All six items clearly tap into one single dimension (Cronbach's alpha 0.73; all item factor loadings above 0.58; explained variance of 44 per cent). Although the Cronbach's alphas decrease to 0.60 when separate factor analyses are run for items 1-3 (self-rule) and 4-6 (shared rule), the factor loadings (above 0.71) and explained variances (56 per cent) are both higher. A more detailed discussion can be found in the Appendix in Supplementary Information. Scores have been averaged across all six items (preferences for regional authority), across items 1-3 (preferences for self-rule) and across items 4-6 (preferences for shared rule). The averages have been subsequently re-scaled so that they vary between a minimum of 0- very undesirable across all items - to a maximum of 1- very desirable across all items (means and standard deviations are provided in Table A2 in the Appendix in Supplementary Information).

In Table 3, we display percentages of types of regionalists found in each of the eight countries. Respondents are classified according to type of regionalist according to their combined preferences for self-rule and for shared rule. Non-regionalists prefer neither (scores below 0.5), whereas full regionalists prefer both (scores above 0.5). Dual regionalists have a preference for self-rule (scores above 0.5) but not for shared rule (scores below 0.5), whereas cooperative regionalists have a preference for shared rule (scores above 0.5) but not for self-rule (scores below 0.5).

Table 3 reveals that, except for Belgium, an absolute majority of respondents are full regionalists who prefer both self-rule and shared rule (in Germany this majority is very slim). Thus, most citizens have the potential to behave 'paradoxically' if these preferences for full regionalism are linked to an inconsistent set of preferred policy outcomes. However, considerable shares of respondents are likely not to behave 'paradoxically' because they are non-regionalists, or prefer self-rule over shared rule (dual regionalists) or prefer shared rule over self-rule (cooperative regionalists). Belgium stands out with a relatively high share of non-regionalists (31.6 per cent),

Table 3.	Type	of	regionalist	ner	country
Iuou J.	1 1 1	OI	regionansi	PCI	Country

		Type	of regionalist		
Country	Non	Dual	Cooperative	Full	Total N respondents
Australia	18.0%	10.4%	13.9%	57.7%	955
Belgium	31.6%	12.5%	13.9%	42.0%	512
Canada	10.8%	11.8%	8.5%	68.9%	627
France	16.2%	8.7%	12.3%	62.8%	586
Germany	10.6%	1.7%	37.0%	50.6%	583
Switzerland	6.2%	2.1%	30.7%	61.0%	567
United Kingdom	16.9%	12.8%	12.8%	57.4%	531
United States	9.7%	15.5%	6.5%	68.4%	569
Total	15.0%	9.5%	16.7%	58.8%	4,930

whereas the highest shares of cooperative regionalists can be found in Germany (37.0 per cent) and Switzerland (30.7 per cent). The United States has the highest share of dual regionalists (15.5 per cent), although the difference with most other countries in the study is relatively small. These country differences can be largely explained by various levels of decentralisation across the countries (Schakel & Brown 2021). In the models presented below, we control for differences in decentralisation across regions and countries by including self-rule and shared rule scores for all regions taken from the Regional Authority Index (Hooghe et al. 2016), as well as country dummies. We also use the country dummies to account for differing countrywide levels of preference for self-rule and for shared rule.

The dependent variables: Preferences for regional reform and inter-regional fiscal transfers

The ICVS contains two items that can be used to capture the two arms of the devolution paradox: preference for stronger regional power and preference for uniformity of public provision. We use the following question to tap into citizens' preferences regarding the powers of regional government.

Now a question about [INSERT COUNTRY]'s system of government in the future – say, 20 years from now.

Thinking about the structure of [INSERT COUNTRY]'s system of government, which *one* of the following systems do *you* personally think would be the *best* system in the future?

- 0 = A system with a single national government but no [state] governments.
- 1 = A system in which [state] governments have fewer powers than they do now.
- 2 = A system where the [state] governments have the same powers as they do now.
- 3 = A system in which [state] governments have more powers than they do now.

T 11 1	D C		c			
Table 4	Preferences or	regional	retorm	ın	eight	countries

Country	No regional government	Fewer powers	Same powers	More powers	Region independent	Total N respondents
Australia	20.9%	16.8%	33.6%	25.7%	3.0%	955
Belgium	28.7%	16.4%	23.2%	24.2%	7.4%	512
Canada	8.1%	19.8%	45.1%	20.1%	6.9%	627
France	12.5%	12.6%	27.0%	42.7%	5.3%	586
Germany	11.5%	19.7%	35.0%	26.6%	7.2%	583
Switzerland	9.2%	17.5%	52.0%	16.8%	4.6%	567
United Kingdom	13.2%	17.1%	24.7%	37.1%	7.9%	531
United States	6.7%	14.8%	42.7%	30.4%	5.4%	569
Total	14.2%	16.9%	35.6%	27.7%	5.7%	4930

Notes: Shown are the percentages of respondents who indicated their preference on the system of government in 20 years time.

4 = A system that allows a [state] to become an independent nation.

5 = Can't say.

The word 'state' was replaced by the appropriate regional label in the preferred language opted by the respondent. Respondents who opted for option 5 'can't say' are excluded.

Table 4 provides an overview of how respondents answered this question in each of the eight countries. The highest support for weak or no regional government is found in Australia (37.7 per cent) and Belgium (45.1 per cent), while respondents in the unitary countries of France (48.0 per cent) and the United Kingdom (45.0 per cent) are strongest in favour for more regional authority (more regional powers or regional independence). Respondents in the decentralised federations of Canada (45.1 per cent), Switzerland (52.0 per cent) and the United States (42.7 per cent) have the highest proportions of citizens who are happy with the status quo (regions should have their current powers).

Preferences for inter-regional fiscal transfers to ensure equality of public services are measured by the following question.

To what extent do you agree or disagree with each of these statements?

Money should be transferred from the *richer* parts of [NAME OF COUNTRY] to the *poorer* parts to ensure that everyone can have similar levels of public services.

- 0 =Strongly disagree
- 1 =Somewhat disagree
- 2 =Somewhat agree
- 3 = Strongly agree
- 4 = Can't say

Respondents who opted for option 4 'can't say' are excluded.

Table 5.	Preferences on	inter-regional	fiscal	transfers	in eight	countries

Country	Strongly disagree	Somewhat disagree	Somewhat agree	Strongly agree	Total N respondents
Australia	6.3%	17.4%	47.9%	28.5%	955
Belgium	14.8%	21.3%	42.6%	21.3%	512
Canada	6.1%	14.0%	48.0%	31.9%	627
France	6.7%	18.9%	44.4%	30.0%	586
Germany	5.1%	15.1%	49.4%	30.4%	583
Switzerland	4.1%	12.9%	44.4%	38.6%	567
United Kingdom	4.7%	14.9%	41.8%	38.6%	531
United States	17.6%	19.2%	35.5%	27.8%	569
Total	7.9%	16.7%	44.6%	30.8%	4930

Notes: Shown are the percentages of respondents who indicated their level of agreement on the statement that money should be transferred from the richer parts of their country to the poorer parts to ensure that everyone can have similar levels of public services.

Table 5 provides an overview of how respondents answered this question in each of the eight countries. Three-quarters of the respondents somewhat agree or strongly agree with the statement that inter-regional fiscal transfers should be used to ensure similar levels of public services, while a quarter of the respondents somewhat disagree or strongly disagree with this statement. Respondents from Belgium (63.9 per cent) and the United States (63.3 per cent) are least in favour of transfers to ensure similar public services, whereas respondents from Switzerland (83.1 per cent) and the United Kingdom (80.4 per cent) are most in favour for fiscal solidarity to ensure equal public services across the country.

Method and control variables

The impact of preferences for regional authority on preferences for regional reform and interregional fiscal transfers are analysed with multilevel regression models whereby 4,930 respondents are clustered in 142 regions. Country dummies are included to account for clustering of regions by country. In addition, country dummies account for other country-level factors that impact on preference scores but are not included in the model. This model specification is chosen because variance decomposition models reveal that the variances in the scores on the dependent variables (preferences for regional reform and preferences for inter-regional transfers) as well as on the main independent variables (preferences for regional, authority, for self-rule and for shared rule) are statistically significant at the country (3–8 per cent), regional (1–2 per cent) and respondent (above 90 per cent) level (Tables A3 and A4 in the Appendix in Supplementary Information). We run two types of models to provide empirical evidence that preferences for self-rule and for shared rule have a different impact on preferences for regional reform and for inter-regional fiscal transfers. The first model includes preference scores for regional authority, whereas the second model includes preference scores for self-rule and for shared rule.

The models include several control variables, six of which vary at the region level. Self-rule is the authority exercised by a regional government over those living in its territory, measured on a scale of 0 to 18. Shared rule is the authority exercised by a regional government or its

representatives in the country as a whole, measured on a scale ranging from 0 to 12 (Hooghe et al. 2016). Citizens from regions with higher regional self-rule scores might have less appetite for regional reform, whereas citizens from regions with higher regional shared rule scores could be more supportive of inter-regional fiscal transfers. We include country dummies in the models because most variation in regional self-rule and shared rule scores occurs between rather than within countries. Hooghe et al. (2016) classify regions on the basis of whether a region has an authority arrangement that sets it apart from the other regions within the country. The models below include a differentiated dummy when a region has such an authority arrangement.² Citizens from differentiated regions might be expected to want stronger regional autonomy and fewer fiscal transfers.

To capture the impact of the socio-economic context of a region we include three variables. First, a language region dummy variable scores positive when a majority of the citizens within a region speaks a different language from the dominant national language (Hooghe et al. 2016; Shair-Rosenfield et al. 2020).³ Citizens from a linguistically distinctive region may be more supportive of regional reform that strengthens regional autonomy and they could have lower preferences for inter-regional fiscal transfers. Second, we include a fiscal donor region dummy variable that scores positive when – in 2017 or a previous year close to 2017 – a region contributes more to than it receives from fiscal equalisation (Australia, Belgium, Canada, Germany and Switzerland) or pays more federal/central government tax than it receives in fiscal transfers from the federal/central government (France, the United Kingdom and the United States; Brenton 2020; Office for National Statistics 2021; Rockefeller Institute of Government 2017; Siliverstovs & Thiessen 2015; Van Rompuy 2010).⁴ Third, a regional economy ratio variable measures regional per capita economic wealth relative to the national average in GDP per capita in 2017 (OECD 2021). Citizens from donor regions and economically richer regions within any country may prefer more regional autonomy and lower inter-regional fiscal transfers.

The models below also include a battery of control variables at the individual level which are generally included in models analysing public opinion on regional government (Henderson et al. 2014; Kincaid & Cole 2016): gender (0 = male; 1 = female), age category (1 = below 30; 2 = 30–39; 3 = 40–49; 4 = 50–59; 5 = 60 and above), university education (0 = less than university education; 1 = university education), household income category (1 = first quartile; 2 = second quartile; 3 = third quartile; 4 = fourth quartile within a country), political interest, 5 ideological self-placement, 6 relative trust in regional government 7 and satisfaction with democracy. 8 Respondents who opted for the 'can't say' option are excluded. As noted earlier, the models include country dummies to control for varying overall levels of preferences for self-rule and for shared rule between countries (Table 3). Descriptive statistics for the dependent and independent variables are provided in Table A5 in the Appendix in Supplementary Information.

Results

Table 6 displays the results of four multilevel regression models. In the first two models, shown on the left side of the table, preferences for regional reform is the dependent variable, whereas the third and fourth models on the right side use preferences for inter-regional fiscal transfers as the dependent variable. The first model for each dependent variable uses preferences for regional authority as the main independent variable, whereas the second model in each set adopts preferences for self-rule and for shared rule as the main independent variables.

Table 6. Explaining preferences for regional government reform and for inter-regional fiscal transfers from rich to poor regions

Notes: *p < 0.10; **p < 0.05; ***p < 0.01. Shown are the results of a multilevel regression model whereby 4,930 respondents are clustered within 142 regions. Preferences for regional government vary from 0 (no regional government) to 4 (region should become an independent nation). Preferences for fiscal transfers from rich to poor regions vary from 0 (strongly disagree) to 3 (strongly agree). Preference for regional authority is strongly associated with both preferences for regional reform and for inter-regional fiscal transfers. An increase of 0.10 in the preference score for regional authority leads to an increase of 0.07 in the preference score for regional reform and to a 0.10 increase in the preference score for inter-regional fiscal transfers.⁹

When preference scores for self-rule and shared rule are used in the models, the results provide strong empirical evidence for the two hypotheses set out in this paper. Preferences for self-rule are positively related to preferences for regional reform that strengthen regional government, while preferences for shared rule are positively related to fiscal transfers from poorer to richer regions. It appears that preferences for reform to strengthen regional powers relate only to preferences for self-rule. An increase of 0.10 in the preference score for self-rule is associated with an increase of 0.06 in the preference score for regional reform. In stark contrast, preference scores for shared rule does not relate to preferences scores for regional reform. On the other hand, support for interregional fiscal transfers to achieve uniform public services appears to relate to both preferences for self-rule and for shared rule; however, the size of the beta coefficient of the latter is almost twice as large than that of the former. An increase of 0.10 in the shared rule preference score is correlated with an increase of 0.07 in the preference score for inter-regional fiscal transfers, compared with an increase of just 0.04 when self-rule preference scores rise by the same amount. These contrasting relationships are robust across different model specifications, that is, an OLS specification with region dummies, a multilevel ordinal logit model specification, and a 'jackknife' assessment whereby a different country is excluded each time the model is run (Tables A6, A7, A8a and A8b in the Appendix in Supplementary Information).

The results for the individual level control variables contribute to the validity of the overall model results. As expected, respondents with higher household incomes and those who place themselves on the right tend to be less in favour of inter-regional fiscal transfers from richer to poorer regions. Respondents who have a household income in the first quartile within their country (score of 1) have a 0.36 higher preference for inter-regional fiscal transfers than respondents who have a household income in the fourth quartile (score of 4). A respondent who places herself at the extreme left (score of 1) has a 0.55 higher preference score for inter-regional transfers compared with a respondent who places herself at the extreme right (score of 11). Similarly, respondents who place more trust in their regional than in their national governments and respondents who are dissatisfied with how democracy functions are more supportive of regional reform that strengthens regional autonomy. Respondents who have full confidence in regional government but no confidence in national government (score of 3) have a 0.73 higher score for regional reform compared to a respondent who places equal confidence in both regional and national government (score of 0). Respondents who are very dissatisfied with how democracy works in their country (score of 4) have a 0.35 higher preference score for regional reform than respondents who are very dissatisfied (score of 1).

The results also reveal relationships that are more difficult to explain. On regional reform, women have a 0.15 higher score than men and respondents who are 60 years or older (score of 5) have a 0.15 higher score than respondents who are younger than 30 years (score of 1). A respondent who is very interested in politics (score of 4) has a 0.16 lower preference score for regional reform but a 0.13 higher preference score for inter-regional fiscal transfers compared with a respondent who is not interested in politics at all (score of 1).

In a similar vein, some results for the regional level variables are in line with our expectations, whereas other results are more puzzling. As expected, respondents from donor regions have

stronger preferences for regional reforms (0.08 higher preference score) and weaker preferences for inter-regional fiscal transfers (0.06 lower preference score). Respondents from language regions do not differ from others on regional reforms and are less supportive of fiscal transfers from richer to poorer regions (0.19 lower preference score).

Interestingly, respondents from regions with more shared rule favour regional reform that strengthens regional autonomy and respondents from differentiated regions tend to be more supportive of inter-regional fiscal transfers from richer to poorer regions. Since the models include country dummies, the shared rule score of a region and the differentiated region dummy explain variation in public opinion across regions within the same country. The preference score for regional reform that strengthens regional autonomy increases with 0.06 points for each additional point on a region's shared rule score. This results, for example, in a 0.36 higher preference score for respondents from Wales or Scotland (shared rule score of 6.5) when compared to respondents from London (shared rule score of 0.5) and from regions in the UK (shared rule score of 0). However, regions with higher shared rule scores than other regions within the country are also differentiated regions (e.g. Quebec, Scotland and Wales). Thus, respondents from these regions are also more supportive towards inter-regional fiscal transfers from richer to poorer regions and have a 0.22 higher preference score for inter-regional fiscal transfers compared to respondents from 'standard' regions within their country.

Discussion and conclusion

This article makes two important contributions towards better understanding the devolution paradox and, more generally, citizens' attitudes regarding multilevel governance. First, it develops two indicators that tap into diffuse regime support regarding regional government across federal and non-federal countries: citizens' preferences for self-rule and their preferences for shared rule. Second, the paper presents strong empirical evidence that preferences for self-rule and for shared rule both drive public opinion towards specific policies related to the devolution paradox in different ways. Preferences for self-rule are strongly related to positive attitudes towards reforms that strengthen regional government, whereas preferences for shared rule are most strongly associated with favourable opinions towards fiscal transfers from rich to poor regions.

A large number of citizens combine a preference for self-rule with a preference for shared rule (see Table 3). This combination does not affect citizens' attitudes to the powers of regional governments, since variations in preferences for regional powers are not associated with variations in shared rule preferences. Self-rule is doing all the work here (see Table 6). Those respondents who highly favour both self-rule and shared rule may well think that increased regional autonomy should go hand-in-hand with increased regional participation in state-wide decision making, or with stronger coordination between regional governments, or both (Galais et al. 2014). Why does increased support for self-rule also increase support for fiscal equalisation, albeit more weakly than support for shared rule? A speculative but plausible answer may be that supporters of more regional power may see fiscal transfers from wealthier to poorer regions as necessary to ensure that regions have the resources to exercise their expanded powers.

Focusing on the devolution paradox from a different angle to ours, Henderson et al (2013: 319) noted that 'a paradox can refer to an apparent contradiction that dissolves on closer or deeper analysis'. That is also the main lesson of our analysis. The devolution paradox is less

of a contradiction than it first appears because its two arms – more regional power and policy uniformity – must be understood as resting on more complex and nuanced attitudes toward self and shared rule. Our findings, like those of other researchers, reveal 'a sophisticated form of multilevel citizenship' whose assumptions vary between individuals across different social groups, regions and countries (Wincott & Wyn Jones 2014: 185; see also Henderson et al. 2013: 319).

The results presented in this paper also reveal that there is still much to be learned regarding the causal drivers of citizen preferences towards regional government. Most importantly, the results imply that for a better understanding of citizen attitudes towards regional government, one needs to gauge preferences for self-rule and for shared rule separately, rather than focusing on regional authority in general.

In addition, researchers would be well advised to investigate the combined impact of preferences for self-rule and shared rule to understand how these preferences may affect different sets of policy outcomes or have competing impacts on a single policy outcome (Weissert & Jones 2015). This paper hints at one example of these possible policy specific effects. Almost 13 per cent of the respondents (634 out of 4,930) are strong supporters of regional reform (their region should have more powers or should become independent) and intergovernmental transfers (agree or strongly agree) but they prefer regions not to have shared rule (preference score below 0.5). These respondents may appear 'paradoxical' because interregional fiscal transfers are often negotiated between regional and central governments, but these respondents may turn out not to be 'paradoxical' when they think that central governments are best equipped to redistribute tax revenues across the territory and that regional involvement is not necessary or desirable.

Notes

- 1. The first component 'feelings of regional equity' comprises responses to: 'The federal and regional governments work well together'; 'Your constituent unit is treated with the respect it deserves in your country's federal system of government'; 'Federalism has more advantages than disadvantages for my constituent unit'; and 'Under the current system, all regions of the country are treated equally'. The second component 'feelings of regional subordination' consists of responses to: 'The federal government does not transfer the fair amount of money to my constituent unit' and 'The federal government interferes in regional decision-making', Kincaid and Cole (2016: 63).
- There are 11 differentiated regions: Australian Capital Territory and Northern Territory in Australia; Brussels, Flanders, Région Wallonne in Belgium; Quebec in Canada; London, Northern Ireland, Scotland and Wales in the United Kingdom; Washington DC in the United States.
- There are 12 language regions: Flanders in Belgium; Quebec in Canada; Alsace, Bretagne and Languedoc-Roussillon in France; Bavaria in Germany; and French-speaking cantons in Switzerland: Fribourg, Geneva, Jura, Neuchatel, Valais and Vaud.
- 4. There are 40 donor regions. Australia: New South Wales, Victoria, Western Australia. Belgium: Flanders. Canada: Alberta, British Colombia, Newfoundland and Labrador, Saskatchewan. France: Alsace, Ile-de-France, Rhone-Alpes. Germany: Baden-Württemberg, Bayern, Hessen, Niedersachsen, Nordrhein-Westfalen, Rheinland-Pfalz, Schleswig-Holstein. Switzerland: Basel Stadt, Geneve, Nidwalden, Schwyz, Zug, Zurich. United Kingdom: East of England, Greater London, South East England. United States: California, Colorado, Connecticut, Illinois, Massachusetts, Minnesota, Nebraska, New Hampshire, New Jersey, New York, North Dakota, Texas, Wyoming.
- 5. How interested would you say you are in politics? 1 = not at all interested; 2 = not very interested; 3 = quite interested; 4 = very interested.
- 6. Many people use the terms 'left' and 'right' to describe different political views. Thinking of your own political views, how would you position yourself? Scores vary from left (= 1) to right (= 11).
- 7. Overall, how much trust and confidence do you have in each level of government to do a good job carrying out its responsibilities? 1 = none at all; 2 = not very much; 3 = a fair amount; 4 = a great deal. We use a measure of relative trust by subtracting trust in federal/national government from trust in state/regional government relative to. Scores vary from -3 (no trust in state/regional government but a great deal of trust in federal/national government) to +3 (a great deal of trust in state/regional government but no trust in federal/national government).
- 8. On the whole, how well do you think democracy works in [insert country] today? 1 = not at all well; 2 = not very well; 3= quite well; 4 = very well.
- Because preference scores for regional authority, self-rule and shared rule vary between 0 and 1 the numbers can
 also be interpreted as an increase or decrease in percentage points by multiplying the mentioned numbers by 100
 (e.g., 0.10 equals 10%).
